

MANAGING LINKS BETWEEN PROCESSOR-BASED SYSTEMS

Abstract of the Disclosure

Software on one system may query nodes which need to be addressed by clients on the system to determine whether  
5 those nodes are accessible. The software may query those nodes by sending a discovery message to those nodes and monitoring for a discovery response. If the discovery response is received, the software clients may be notified that the connection is existing and can be used to access  
10 the remote nodes.
